/done libe="potento abiotic stress cDNA library"
/done libe="potento abiotic stress cDNA; Site_2: Not; suppleter: Solamum tuberosum var. Kennebec plants were grown from cuttings on a l6hr light/8 hr dark cycle at 5 c for 3-4 weeks. Abiotic stress conditions were applied to four separate sets of plants; Set 1 involved asturation of the soil with 150 mM NaCl and tissues were harvested at following application of the salt stress (leaves: 2hr, 6hr, 12hr, 1d, 2d, and 4d; roots:2hr, 6hr, 12hr, and 2d). Set 2 were grown under the standard conditions and then were water stressed by withdrawal of further watering applications. Drought stressed alpants were harvested after cessation of watering (leaves: 3d, 5d, and 7d; roots:3d and 5d). Set 3 were grown under the standard conditions and then were cold stressed by placement at 4 C. Cold stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and hear stressed roots were harvested at 6 hr, 12 hr, 1 d, at the were one tressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d and hear stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d and hear stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d and hear stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d rom each tissue and stress was pooled to construct the cDNA library. RNA sample."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 10,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 8,

```

The invention relates to a general primer or primer pair for amplifying and detecting or for use in a nucleic acid amplification process for amplifying Human Papillomavirus (HPV) genotypes. The general primers are useful for amplifying cervical-neoplasia related HPV genotypes including

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring pene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acid further comprises a tag sequence. The array of nucleic acid
oncogenic high-risk groups and low-risk groups. The general primers are useful for producing amplifying products to DNA of scores of diverse oncogenic HPV types and thus detecting the oncogenic HPV types in a sample but also to select cervical carcinoma and its pre-stage lesions at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               probes is useful in a situ hybridisation, in Southern, Northern or dot-
blot hybridisation to identify or detect the sequence or specific
mutations of any gene, in mapping the 5' termini of mRNA molecules by
primer extensions or in screening CDNA or genomic libraries or subclones
for additional subclones containing segments of DNA that have been
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;
                                                                            early stage by improving sensitivity according to HPV types. This sequence corresponds to PCR primer used in the invention.
                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Probe 36 maps to HPV types 6 (6365-6402), 11 (6350-6387), 16 (6225-6262), 18 (6201-6238) and 33 (6182-6219). Sequences were selected according to a unique algorithm developed to choose consensus sequences. The sequences represented in AAQ23167-88 are consensus sequences selected so each should hybridise with each of human HPV types 6, 11, 16, 18 and 33. The sequences represented in AAQ23055-189 and AAQ25590 allow the equences represented in AAQ23055-189 and AAQ25590 allow the using PCR or LCR amplification procedures. The use of nucleic acids allows greater discrimination among viral subtypes than antibodles, and the use of DNA-based tests increases both the sensitivity and the specificity of prior-art antibody based tests. The oligonuclectides can be used either to detect specific sequences of specific HPV types, or
isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Compsns. for amplifying DNA of human papilloma virus by LCR and PCR - consensus and type specific oligo-nucleotide(s), for diagnosis of HPV-esp. types 6,11,16,18 33 and 61.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The detection is either by PCR or LCR. Alternatively the sequences can be labelled with fluorescein or biotin and used as probes. (Updated on 25-

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gape
                                                                                                                                                                                                                                                                                         Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.

The invention relates to enzymatic nucleic acid molecules that down captalate expression of chloride channel calcium activated 1 (CLCA1) genes consider a paramaceutical agents. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic cobstructive pulmonary disease (OPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions contracted to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chence, are useful for treatment of a patient having a condition contracted with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to camine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; chloride channel calcium activated 1; CLCA1; ss; antiasthmatic; antinflamatory; chronic obstructive pulmonary disease; COPD; asthma; chronic bronchitis; cystic fibrosis; obstructive bowel syndrome; oxygen therapy; bronchodilator; corticosteroid; vaccination; mucokinetic; acetylcysteine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99999 and ABI00010-ABI82073 targement the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; chloride channel calcium activated 1; CLCA1; ss; antiasthmatic; antiinflammatory; chronic obstructive pulmonary disease; COPD; asthma; chronic bronchitis; cystic fibrosis; obstructive bowel syndrome; oxygen therapy; bronchodilator; corticosteroid; vaccination; mucokinetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                       set or oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Szymkowski DE;

regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as phramaceutical agents for treating conditions such as chronic obstructive pulmonary disease (CCDP), chronic bronchitis, asthma, cystic that are related to or will respond to the levels of CLCA1 in a cell or issue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition casciated with the level of CLCA1, where the invention further comprises the use of one or more therapy under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, and and mutations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the example of CLCA1 RNA in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 17 BP; 6 A; 1 C; 6 G; 0 T; 4 U; 0 Other;

channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma. Enzymatic polynucleotide that down regulates expression of chloride WPI; 2002-217145/27.

Claim 4; Page 113; 152pp; English.

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic

obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLGA1 in a cell or tissue. The sequences are useful for reducing CLGA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as disgnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an enzymatic nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The capture oligonucleotide AAQ61872 has unique specificity for the HPV-18 genome and is complementary to the region around nucleotide 6779 of HPV-18. The capture probe is immobilised for use in a sandwich hybridisation assay. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New conjugate for bio:luminescent hybridisation or immunoassay - comprises kinase or dehydrogenase coupled to specific ligand for the analyte, partic. for detecting human papilloma virus.
                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human papilloma virus; HPV; detection; assay; cervical cancer; nucleic acid hybridisation; capture probe; sandwich assay; ss.

```
The invention relates to a method for detecting and/or quantifying a target nucleotide sequence in a biological sample. It comprises contacting the sample with an immobilised capture probe and a labelled detection probe. The capture probe is a single-stranded oligonucleotide that is complementary to part of the target sequence and is covalently coupled at one end to a solid support. The detection probe is covalently complementary to another part of the target sequence. The capture probe has a length of 50-500 bases, and a portion of the capture probe that does not hybridise with the target sequence. Use of long, highly complementary capture probes improves specificity and sensitivity. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
```

```
The invention relates to pharmaceutical compositions that comprise an agent that inhibits the expression or activity of a tumour-associated antigen (TAG) that is encoded by a nucleic acid. The pharmaceutical compositions and related compositions, are used for treatment of diseases associated with (abnormal) expression of TAG, specifically cancer e.g. of lung, breast, prostate, colon, stomach, pancreas, ear/nose/throat, kidney or cervix, also melanoma. Compositions containing TAG, or related nucleic acid, antibodies or host cells, are also useful for diagnosis and monitoring of tumours. The present sequence represents a human CLCA1 reverse transcriptase (RT)-PCR primer.

oncogenic HPV types and thus detecting the oncogenic HPV types in a sample but also to select cervical carcinoma and its pre-stage lesions at early stage by improving sensitivity according to HPV types. This sequence corresponds to PCR primer used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of amplification primer QAL48. This is one of a set of claimed amplification and detector primers and probes (see ABN84687-723) derived from the HIV-1 polymerase (pol) gene, which facilitate the detection and/or quantification of all presently known spencypes of HIV-1 (A-I and O). These primers and probes can be used in a variety of amplification and non-amplification formats for the detection of HIV nucleic acids. The present primer contains a 3 target binding sequence. The remaining 5' portion of the primer comprises a restriction amplification (SDA) reaction of the primer comprises a restriction amplification (SDA) reaction to proceed, and a generic non-target-specific tail sequence. The 'L' in the primer may alternatively be used as a hybridisation probe for direct detection of HIV-1, either without prior amplification or as a post-amplification assay. The primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel oligonucleotide useful for detecting multiple human immunodeficiency virus-1 genotypes, has sequence consisting of target binding sequence and optionally, a sequence for selected

                                                                                                                                                                                                                                                                                The invention relates to a polynucleotide comprising an RNA sequence. The bolynucleotides, vector, libraries, and method are useful in lowering the amount of RNA and/or protein production in cells used in drug development process. The present sequence represents a knock-down target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a general primer or primer pair for amplifying and detecting or for use in a nucleic acid amplification process for amplifying Human Papillomavirus (HPV) genotypes. The general primers are useful for amplifying cervical-neoplasia related HPV genotypes including oncogenic high-risk groups and low-risk groups. The general primers are useful for producing amplifying products to DNA of scores of diverse
